

WHAT IS CLAIMED IS:

1. A method of receiving encoded and then shuffled data in a communication system supporting multi-level demodulation, comprising the
5 steps of:

demodulating received data according to a predetermined demodulation scheme and outputting a modulation symbol having a predetermined number of code symbols;

10 deshuffling the code symbols in a deshuffling order corresponding to shuffling, the deshuffling order being determined considering the demodulation scheme and a structure of a deshuffling memory device; and

reading the deshuffled code symbols, decoding the code symbols at a predetermined code rate, and outputting an packet.

15 2. The method of claim 1, wherein in the deshuffling step, the code symbols are stored at write addresses in the deshuffling memory device, which are generated according to the demodulation scheme by

- 20 i) QPSK: $WA = (SA + 2xmi + ci) \bmod P_{MAX}$
 ii) 8-PSK: if $ci=0$, $WA = (SA + mi + 2N_{SP}/3) \bmod P_{MAX}$
 else, $WA = (SA + 2xmi + ci - 1) \bmod P_{MAX}$
 iii) 16-QAM: if $ci \bmod 2 = 0$, $WA = (SA + 2xmi + ci/2 + N_{SP}/2) \bmod P_{MAX}$
 else, $WA = (SA + 2xmi + ci/2) \bmod P_{MAX}$

25 where WA is a write address, SA is a start address depending on the index of received packet data, mi is the index of a demodulated symbol, ci is the index of a code symbol in the demodulated symbol, N_{SP} is the length of the received packet data, P_{MAX} is the maximum bit index of packet data generated from a code sequence according to a packet size, and mod represents a modulo operation.

30 3. The method of claim 1, wherein in the code symbol deshuffling

step, the code symbols are separated into systematic symbols with a relatively high priority and parity symbols with a relatively low priority, and the systematic symbols and the parity symbols are stored in separate memories.

5 4. The method of claim 3, wherein the code symbol deshuffling step further comprises the steps of:

generating temporary addresses according to the deshuffling order considering the demodulation scheme;

generating write addresses using the temporary addresses considering the
10 separate memories; and

storing the code symbols at the write addresses in the separate memories.

5. The method of claim 1, wherein the code symbol deshuffling step comprises the steps of:

15 separating the code symbols into systematic symbols with a relatively high priority and parity symbols with a relatively low priority, and storing the systematic symbols and the parity symbols in separate memories;

generating temporary addresses according to the deshuffling order according to the demodulation scheme ;

20 generating write addresses using the temporary addresses considering the separate memories; and

storing the code symbols at the write addresses in the separate memories.

6. The method of claim 5, wherein the temporary addresses are
25 generated according to the demodulation scheme by

i) QPSK: $TA = (SA + 2xmi + ci) \bmod P_{MAX}$

ii) 8-PSK: if $ci=0$, $TA = (SA + mi + 2N_{SP}/3) \bmod P_{MAX}$

else, $TA = (SA + 2xmi + ci - 1) \bmod P_{MAX}$

30 iii) 16-QAM: if $ci \bmod 2 = 0$, $TA = (SA + 2xmi + ci/2 + N_{SP}/2) \bmod P_{MAX}$

$$\text{else, } TA = (SA + 2xmi + ci/2) \bmod P_{MAX}$$

where TA is a temporary address, SA is a start address depending on the index of received packet data, mi is the index of a demodulated symbol, ci is the index of a code symbol in the demodulated symbol, N_{SP} is the length of the received
 5 packet data, P_{MAX} is the maximum bit index of packet data generated from a code sequence according to an packet size, and mod represents a modulo operation.

7. The method of claim 5, wherein if the packet is 408, 792 or 1560 bits, the write addresses are generated by

10

$$i) 0 < TA < N_{EP}$$

Input Symbols=S, WA=TA: Write to MEM0 (MEM_CS=0)

$$ii) N_{EP} < TA < 3xN_{EP}$$

15

Input Symbols=P0 or P0', WA=TA-N_{EP}: Write to MEM1 (MEM_CS=1)

$$iii) 3xN_{EP} < TA < 5xN_{EP}$$

Input Symbols=P1 or P1', WA=TA-3xN_{EP}: Write to MEM2 (MEM_CS=2)

where TA is a temporary address, N_{EP} is an packet size, S denotes systematic
 20 symbols, P0/P1 denotes first parity symbols, P1/P1' denotes second parity symbols, WA is a final write address, MEM_CS is a memory select signal, and MEM0, MEM1 and MEM2 denote first, second and third memories, respectively.

8. The method of claim 5, wherein if the packet is 2328 bits, the
 25 write addresses are generated by

$$i) 0 < TA < N_{EP}$$

Input Symbols=S, WA=TA: Write to MEM0 (MEM_CS=0)

30

$$ii) N_{EP} < TA < 3xN_{EP}$$

if ((TA-N_{EP}) mod 2=0),

Input Symbols=P0, WA=(TA-N_{EP})/2: Write to MEM1 (MEM_CS=1)

else

Input Symbols= $P0'$, $WA=(TA-N_{EP})/2$: Write to MEM2 ($MEM_CS=2$)

iii) $TA > 3 \times N_{EP}$

5 if $((TA - 3 \times N_{EP}) \bmod 2 = 1)$,

Input Symbols= $P1'$, $WA=(TA - 3 \times N_{EP})/2 + 2328$: Write to MEM1 ($MEM_CS=1$)

else

Input Symbols= $P1$, $WA=(TA - 3 \times N_{EP})/2 + 2328$: Write to MEM2 ($MEM_CS=2$)

where TA is a temporary address, N_{EP} is an packet size, S denotes systematic
 10 symbols, $P0/P1$ denotes first parity symbols, $P1/P1'$ denotes second parity
 symbols, WA is a final write address, MEM_CS is a memory select signal, and
 MEM0, MEM1 and MEM2 denote first, second and third memories, respectively.

9. The method of claim 5, wherein if the packet is 3096 or 3864
 15 bits, the write addresses are generated by

i) $0 < TA < N_{EP}$

Input Symbols=S, $WA=TA$: Write to MEM0 ($MEM_CS=0$)

20 ii) $TA > N_{EP}$

if $((TA - N_{EP}) \bmod 2 = 0)$,

Input Symbols= $P0$, $WA=(TA - N_{EP})/2$: Write to MEM1 ($MEM_CS=1$)

else

Input Symbols= $P0'$, $WA=(TA - N_{EP})/2$: Write to MEM2 ($MEM_CS=2$)

25 where TA is a temporary address, N_{EP} is an packet size, S denotes systematic
 symbols, $P0/P1$ denotes first parity symbols, $P1/P1'$ denotes second parity
 symbols, WA is a final write address, MEM_CS is a memory select signal, and
 MEM0, MEM1 and MEM2 denote first, second and third memories, respectively.

30 10. The method of claim 1, wherein the demodulation scheme is a
 multi-level demodulation scheme having a demodulation order of 3 or higher.

11. An apparatus for receiving encoded and then shuffled data in a communication system supporting multi-level demodulation, comprising:

a demodulator for demodulating received data according to a predetermined demodulation scheme and outputting a modulation symbol having
5 a predetermined number of code symbols;

a storage for storing the code symbols in a deshuffling order corresponding to shuffling, the deshuffling order being determined considering the demodulation scheme and the structure of the storage; and

a decoder for reading the stored code symbols, decoding the code
10 symbols at a predetermined code rate, and outputting an packet.

12. The apparatus of claim 11, wherein the storage stores the code symbols at write addresses generated according to the demodulation scheme by

- 15
- i) QPSK: $WA = (SA + 2xmi + ci) \bmod P_{MAX}$
 - ii) 8-PSK: if $ci = 0$, $WA = (SA + mi + 2N_{SP}/3) \bmod P_{MAX}$
 else, $WA = (SA + 2xmi + ci - 1) \bmod P_{MAX}$
 - iii) 16-QAM: if $ci \bmod 2 = 0$, $WA = (SA + 2xmi + ci/2 + N_{SP}/2) \bmod P_{MAX}$
 else, $WA = (SA + 2xmi + ci/2) \bmod P_{MAX}$

20 where WA is a write address, SA is a start address depending on the index of received packet data, mi is the index of a demodulated symbol, ci is the index of a code symbol in the demodulated symbol, N_{SP} is the length of the received packet data, P_{MAX} is the maximum bit index of packet data generated from a code sequence according to an packet size, and mod represents a modulo operation.

25

13. The apparatus of claim 11, wherein the storage comprises:

a first memory for storing systematic symbols with a relatively high priority among the code symbols;

at least one second memory separate from the first memory, for storing
30 parity symbols with a relatively low priority among the code symbols; and

a write address generator for generating a memory select signal indicating one of the first and second memories each time a code symbol is received and a write address indicating a memory area at which the code symbol is to be stored in the selected memory according to a deshuffling order
5 corresponding to shuffling.

14. The apparatus of claim 13, wherein the write address generator comprises:

a temporary address generator for generating a temporary addresses
10 according to the deshuffling order considering the demodulation scheme; and
a final address generator for generating the memory select signal and the write address using the temporary addresses considering the separate memories.

15. The apparatus of claim 11, wherein the storage comprises:
15 a first memory for storing systematic symbols with a relatively high priority;

second and third memories separate from the first memory, for storing first and second parity symbols with a relatively low priority;

a temporary address generator for generating a temporary addresses
20 according to the deshuffling order considering the demodulation scheme; and
a final address generator for generating the memory select signal and the write address using the temporary addresses considering the separate memories.

16. The apparatus of claim 15, wherein the temporary address is
25 generated according to the modulation scheme by

i) QPSK: $TA = (SA + 2xmi + ci) \bmod P_{MAX}$

ii) 8-PSK: if $ci=0$, $TA = (SA + mi + 2N_{SP}/3) \bmod P_{MAX}$

else, $TA = (SA + 2xmi + ci - 1) \bmod P_{MAX}$

30 iii) 16-QAM: if $ci \bmod 2 = 0$, $TA = (SA + 2xmi + ci/2 + N_{SP}/2) \bmod P_{MAX}$

$$\text{else, } TA = (SA + 2xmi + ci/2) \bmod P_{MAX}$$

where TA is a temporary address, SA is a start address depending on the index of received packet data, mi is the index of a demodulated symbol, ci is the index of a code symbol in the demodulated symbol, N_{SP} is the length of the received packet data, P_{MAX} is the maximum bit index of packet data generated from a code sequence according to a packet size, and mod represents a modulo operation.

17. The apparatus of claim 15, wherein if the packet is 408, 792 or 1560 bits, the write address is generated by

10

$$i) 0 < TA < N_{EP}$$

Input Symbols=S, WA=TA: Write to MEM0 (MEM_CS=0)

$$ii) N_{EP} < TA < 3xN_{EP}$$

15

Input Symbols=P0 or P0', WA=TA-N_{EP}: Write to MEM1 (MEM_CS=1)

$$iii) 3xN_{EP} < TA < 5xN_{EP}$$

Input Symbols=P1 or P1', WA=TA-3xN_{EP}: Write to MEM2 (MEM_CS=2)

where TA is a temporary address, N_{EP} is an packet size, S denotes systematic symbols, P0/P1 denotes first parity symbols, P1/P1' denotes second parity symbols, WA is a final write address, MEM_CS is a memory select signal, and MEM0, MEM1 and MEM2 denote first, second and third memories, respectively.

18. The apparatus of claim 15, wherein if the packet is 2328 bits, the write address is generated by

25

$$i) 0 < TA < N_{EP}$$

Input Symbols=S, WA=TA: Write to MEM0 (MEM_CS=0)

30

$$ii) N_{EP} < TA < 3xN_{EP}$$

if ((TA-N_{EP}) mod 2=0),

Input Symbols=P0, WA=(TA-N_{EP})/2: Write to MEM1 (MEM_CS=1)

else

Input Symbols= $P0'$, $WA=(TA-N_{EP})/2$: Write to MEM2 ($MEM_CS=2$)

iii) $TA > 3 \times N_{EP}$

5 if $((TA - 3 \times N_{EP}) \bmod 2 = 1)$,

Input Symbols= $P1'$, $WA=(TA - 3 \times N_{EP})/2 + 2328$: Write to MEM1 ($MEM_CS=1$)

else

Input Symbols= $P1$, $WA=(TA - 3 \times N_{EP})/2 + 2328$: Write to MEM2 ($MEM_CS=2$)

where TA is a temporary address, N_{EP} is an packet size, S denotes systematic
10 symbols, $P0/P1$ denotes first parity symbols, $P1/P1'$ denotes second parity
symbols, WA is a final write address, MEM_CS is a memory select signal, and
MEM0, MEM1 and MEM2 denote first, second and third memories, respectively.

19. The apparatus of claim 15, wherein if the packet is 3096 or 3864
15 bits, the write address is generated by

i) $0 < TA < N_{EP}$

Input Symbols=S, $WA=TA$: Write to MEM0 ($MEM_CS=0$)

20 ii) $TA > N_{EP}$

if $((TA - N_{EP}) \bmod 2 = 0)$,

Input Symbols= $P0$, $WA=(TA - N_{EP})/2$: Write to MEM1 ($MEM_CS=1$)

else

Input Symbols= $P0'$, $WA=(TA - N_{EP})/2$: Write to MEM2 ($MEM_CS=2$)

25 where TA is a temporary address, N_{EP} is an packet size, S denotes systematic
symbols, $P0/P1$ denotes first parity symbols, $P1/P1'$ denotes second parity
symbols, WA is a final write address, MEM_CS is a memory select signal, and
MEM0, MEM1 and MEM2 denote first, second and third memories, respectively.

30 20. The apparatus of claim 11, wherein the demodulation scheme is
a multi-level demodulation scheme having a demodulation order of 3 or higher.
